Hi GetBlock team,

I'm applying for the Junior Frontend Engineer role. I'm a frontend-focused developer with a strong UI/QA mindset — I care about pixel-perfect implementation, clean layouts across real devices, and performance that holds up (Core Web Vitals, fast loading, no layout shifts).

I've worked remotely for years and feel completely comfortable in async collaboration: clear status updates, predictable delivery, and respecting deadlines. I don't need micromanagement — I prefer ownership and trust — and flexible working hours are a big plus for me because they let me keep traveling while staying reliable and available.

What I can bring to your web team:

- Landing pages from Figma: careful responsive implementation, consistent spacing/typography, and clean reusable components.
- Performance & SEO basics: image/font optimization, avoiding CLS, Lighthouse checks, and practical fixes in DevTools.
- Safe integrations: adding analytics/marketing scripts (GTM/GA/pixels, widgets) without breaking layout or performance.
- Modern tooling: TypeScript, React/Next.js basics, Git/PR workflow, and daily use of AI tools (Cursor/Codex/Claude) to speed up work while keeping quality.

I'm excited about GetBlock because the product lives in the “developer experience” space: the website and documentation are often the first touchpoint, and the quality of the UI and content really matters. I'd love to help you ship fast, polished pages and keep iterating on them safely.

If it helps, I can share a couple of recent UI examples and walk you through how I approach layout issues, performance checks, and QA in real browsers.

Thanks for your time — looking forward to hearing from you.

Best regards,
Evgenii Rubin
