Hi GoDaddy Hiring Team,

I'm applying for the User Experience Engineer role in Serbia.

My background is UI engineering in a production CMS + design-systems environment, where the "last mile" quality matters: translating design specs into consistent, responsive interfaces and catching edge cases before they reach users. I'm comfortable working closely with designers and stakeholders, turning Figma handoffs into reusable UI patterns, and keeping visual details and behavior consistent across breakpoints and browsers.

What I enjoy most is making interfaces feel "finished": clear typography and spacing, predictable component states (loading/empty/error), solid keyboard/focus behavior, and performance basics that prevent layout shifts. I'm also used to maintaining lightweight QA checklists and documentation so teams can ship reliably at speed.

On the engineering side, I work with React and TypeScript, and I'm steadily expanding my product-facing experience through shipped projects where I focus on maintainable components, API-driven UI, and testing/CI habits. I'm confident collaborating in code reviews and iterating quickly based on feedback.

I'd love to bring this UX-focused engineering mindset to GoDaddy: helping your teams move faster with polished UI, fewer regressions, and a strong design-to-code workflow.

Thank you for your time — I'd be happy to share code samples and walk through a recent UI decision, including trade-offs and QA approach.

Best regards,

Evgenii Rubin
